Summary

Enthusiastic and motivated **Junior React Developer** with solid knowledge of modern **React.js** fundamentals, including **components, props, state management, and hooks** (useState, useEffect, useContext, useReducer). Experienced in building **responsive and interactive user interfaces** using **Tailwind CSS**, modals, portals, and modern web development best practices. Passionate about creating **clean, maintainable code** and continuously learning new technologies. Adept at **collaborating in team projects** and eager to contribute to real-world web applications.

Education

Bachelor of ICT (Information and Communication Technology)
Faculty of Natural Sciences, University of Tirana *Oct 2020 - Jul 2024*
Graduated with honors, focusing on software development and web technologies.

Languages

English ● ● ● ● ○

Experience

IT Support
Electronic Solution Company *Sep 2021 - Aug 2022*

- Installed and configured computer systems
- Troubleshoot software and hardware issues
- Tested new technologies
- Identified and implemented hardware/software solutions

Customer Support
TIBO *Oct 2022 - Jun 2023*

- Assisted clients in resolving technical issues
- Handled complaints and ensured effective communication
- Guided customers step by step through troubleshooting processes

Self-Learning Courses

React - The Complete Guide
Udemy
Learned React fundamentals, hooks, state management, and modern best practices.

Tailwind CSS V4 (+ React) - The beginner guide (In Progress)
Udemy
Learning modern Tailwind v4 with React to build responsive layouts, animations, dark mode, and theme customization.

Skills

- React fundamentals
- JSX syntax
- Component lifecycle
- API integration
- Debugging and testing skills
- ES6 JavaScript
- HTML
- CSS / Tailwind CSS
- Responsive design
- Git version control
- Communication
- Teamwork
- Adaptability

Projects

React Project Management Web App Developer

Description

This project was built as a practical exercise to consolidate both fundamental and advanced React concepts. The application allows managing projects and tasks, demonstrating the use of Components, State, Props (prop drilling), and Tailwind CSS for styling. It also showcases advanced React features such as `useRef`, `useImperativeHandle`, `forwardRef`, and `createPortal`.

Features

- Add new projects
- Select an active project
- Delete projects
- Add tasks to the selected project
- Clear tasks
- Visual highlight for the selected project in the Sidebar
- Input validation (prevents adding empty tasks)
- Fixed React warning (controlled vs uncontrolled input)

Project Goal

This application was built for practice and portfolio purposes, showcasing the ability to:

- Build a clear component structure.
- Manage state at a global level.
- Use advanced React hooks (`useRef`, `useImperativeHandle`, `forwardRef`, `createPortal`).
- Document the project in a professional way.

Timer Challenge Web App

Developer

Description

This is a small React app that demonstrates the use of refs, state, modals, and portals to build an interactive timer challenge game.

The goal is to stop the timer in time — if you succeed, you win and get a score; if not, you lose.

Features

- Timer Challenge : Start, stop, and track remaining time every 10ms.
- Result Modal : Displays win/loss, remaining time, and score.
- Score Calculation : Score from 0–100 based on how close you were to expiry.
- Refs & State : "useRef" for interval/modal, "useState" for remaining time.
- Safe Reset : Timer resets when modal closes (button or ESC).
- Portals : Modal rendered into `#modal` near the document root.
- Player Component : Manages player name and displays it in UI/result.

Project Goal

This application was built for practice and portfolio purposes.

Quiz Web App

Developer

Description

An interactive "Quiz App" built with "React", featuring dynamic timers, visual feedback for answers, and a final summary screen with statistics. This project demonstrates skills in state management, side effects, component refactoring, and modular architecture.

Features

Randomized answers :

- Answers are displayed in a random order for each question.
- Shuffling only occurs when the question changes, avoiding "jumping" answers during re-rendering.

Dynamic timer for each question :

- 10 seconds to select an answer.
- 1 second to highlight and show correctness.
- 2 seconds to remain on the current question before moving on.
- Progress bar with colors based on state (answered, correct, wrong).

Visual feedback for answers :

- Highlight immediately after selection.
- Green for correct answers, red for wrong answers, grey for skipped answers.
- Buttons are disabled after selection to prevent multiple clicks.

Final summary screen :

- Overall statistics: % of correct, wrong, and skipped questions.
- Detailed list for each question: number, text, user's answer, and status.
- CSS classes provide clear visual feedback for each answer.

How It Works ?

1. **Start quiz** → displays the first question with shuffled answers.
2. **Active timer** → the user has 10 seconds to select an answer.
3. **Answer selection** → highlight immediately, correctness after 1 second, transition after 2 seconds.
4. **Automatic skip** → if the timer expires without a selection, the question is skipped.
5. **Summary screen** → after completion, shows statistics and details for each question.

Purpose of the Project

This project was created to strengthen my React fundamentals and showcase:

- Component-based architecture
- State management with hooks
- Dynamic timers and conditional rendering
- Clear documentation and reusable code

It also serves as a portfolio project to demonstrate my skills to potential employers and collaborators.
